II/ Multiple Prize Search Algorithm

Heuristic: Nearest-Neighbour Heuristic

For the multiple goal search algorithm, we chose the Nearest Neighbor Heuristic based on cost. The algorithm will compare the cost to travel from prize to other unvisited prizes and choose the route to the new prize with the least cost. From the new prize, it will repeat the same procedure. After performing with all the prizes, we produce a route that start from the Start position and go through all the Nearest-Neighbor prizes based on cost. With the route between two pair of prizes is the shortest compare with other prizes, this can lead to an optimal route that produce the least cost
